Moody Radio: This Just In

Moody Radio offers new XDS-PROS Receivers for Sale

With the current satellite switch from SES-2 to SES-11 some Moody Radio Affiliates have inquired about the availability of new XDS receivers to replace their aging model XDS-PRO1Q and/or XDS-PRO4Q receivers that were originally deployed in 2012-2013.

Many of these receivers are now 13+ years old and factory repair support for these models ended in 2020. While the new SES-11 satellite feed can still be accessed by the older "Q" model receivers, this may be a good time to consider upgrading to the current "S" model of XDS receivers.

The **XDS-PRO1S** (one audio output) and the **XDS-PRO4S** (four audio outputs) digital media receivers include a 256 GB solid state storage drive, an AES Livewire+ port, as well as the familiar DB-9 analog audio output(s), LAN-1, LAN-2 Ethernet Ports and DB-37 Relay ports. See the technical specification sheet links for each model above.

Most Moody Radio Affiliates can easily proceed forward with a new XDS-PRO1S single audio output receiver and still have access to both Moody-1 and Moody-2 by utilizing the **XDS Affiliate website** for programming and scheduling via the XDS Network Management System.

Moody Radio has a number of XDS-PRO1S and XDS-PRO4S receivers available for Affiliate purchase at the following prices:

XDS-PRO1S (one audio output), with 245 GB SSD - \$2,255.00

XDS-PRO4S (four audio outputs). With 256 GB SSD - \$2,950.00

An additional configuration and handling fee of \$125 per unit would apply, plus shipping. Prices are subject to change. Please reach out to confirm current pricing.

For more information or to begin the ordering process please reach out to Moody Radio Affiliate Relations at **affiliates@moodyradio.org**.
